HOLLOW COLUMN UPLIFT CONNECTIONS

Install hollow column anchorage after the concrete pour, eliminating the need to determine the precise placement of the column during layout. Uplift loads are achieved with a concealed connection using a combination of Simpson Strong-Tie Anchor Systems® mechanical or adhesive anchors and threaded rod or coil strap.

Rod Configuration
This connection utilizes the Simpson Strong-Tie® Titen HD® Rod Coupler or Epoxy-Tie® SET anchoring epoxy for concrete anchorage. A coupler nut, threaded rod and a bearing plate and nut complete the connection to the beam at the top of the column.

INSTALLATION

1) Select the appropriate rod and bearing plate from the table for the required uplift load.
2) Choose either the Titen HD Rod Coupler or SET epoxy solution based upon desired performance characteristics.
3) Mark the slab for the center location of the column.
4) Drill the hole to the specified diameter and depth per requirements for the selected anchor (see table). Minimum concrete thickness shall be 1.5x embedment depth.
5) Install the selected anchor per the installation instructions on the product packaging. For additional installation information reference the Simpson Strong-Tie Anchor Systems Anchoring and Fastening Systems for Concrete and Masonry catalog or visit www.simpsonanchors.com.
6) Drop the appropriate length of A307 threaded rod down the hollow column.
7) Install the beam, drill the appropriate diameter hole in the beam, and run the rod up through the beam. The Designer should be consulted for approval to drill through the beam.
8) Install the CNW coupler nut onto the anchor and install the threaded rod into the coupler nut. Anchor and rod should be visible in the CNW coupler nut Witness® holes after installation.
9) Fasten the rod on top of the beam with a nut and the appropriate bearing plate chosen from the table.

1. See current Simpson Strong-Tie Anchoring and Fastening Systems for Concrete and Masonry catalog for complete SET epoxy and THDC installation details.
2. Allowable loads have been increased for wind loading with no further increase allowed.
3. Minimum concrete compressive strength is 2500psi.
4. ½” Wrench size required.
5. Titen HD rod coupler includes coupler nut for ½” diameter threaded rod.
6. System capacity limited by perpendicular to grain wood bearing capacity (SPF = 425psi, SP = 565psi, DF = 625psi), rod tension capacity or anchorage capacity.
7. Anchor length must be at least 2” longer than embedment depth.
8. Designer may modify epoxy embedment depth and edge and end distances per the Anchoring and Fastening Systems for Concrete and Masonry catalog.

TITEN HD®
Heavy-Duty Screw Anchor

The Titen HD is a patented, high-strength screw anchor for concrete and masonry. The self-undercutting, non-expansion characteristics of the anchor make it ideal for structural applications, even at minimum edge distances and under reduced spacing conditions.

WARNING: Recommended for permanent dry, interior, non-corrosive environments or provide a moisture barrier. Contact Simpson Strong-Tie for more information.

CODES: ICC ESR-1056; City of L.A. RR 25560; FL 2304.2
CMST Strap Configuration
This connection utilizes the Simpson Strong-Tie® Titan HD® or Epoxy-Tie® SET anchoring epoxy for concrete anchorage. A holdown, machine bolts and a field-cut CMST strap complete the connection to the beam at the top of the column. The minimum inside diameter of the column must be 3\(\frac{1}{4}\)" for the CMST strap and a minimum base opening diameter of approximately 7" is required for the HDA holdown. Consult the column manufacturer for minimum column opening diameters.

INSTALLATION
1) Select the appropriate holdown/anchor/strap combination from the table for the required uplift load.
2) Mark the slab for the center location of the column.
3) Drill the hole to the specified diameter and depth per requirements for the selected anchor (see table). Minimum concrete thickness shall be 1.5x embedment depth.
4) Install the holdown using the selected anchor, installing the anchor per the installation instructions on the product packaging. For additional installation information reference the Simpson Strong-Tie Anchor Systems® Anchoring and Fastening Systems for Concrete and Masonry catalog or visit www.simpsonanchors.com.
5) Cut the CMST strap to length so that:
   a) The strap can be installed over the top of the beam (as shown in the drawing) leaving an additional 1\(\frac{1}{2}\)" from the last face nail to the end of the strap.
   b) The strap runs down the center of the column to connect with the holdown leaving an additional 1\(\frac{1}{2}\)" of the strap below the bottom hole in the holdown.
6) Overlap the CMST strap with the back side of the holdown and mark the locations for the holdown bolt holes (maintaining the 1\(\frac{1}{2}\)" edge distance).
7) Drill the holes in the strap and attach it to the holdown using the strap bolts called out in the table (see table for drill bit and bolt size).
8) Set the column in place and pull the CMST strap tight over the top of the beam, bending it so it sits snug. While the strap is held tight, fasten it to the beam using the fasteners shown in the table.
